In 2019, patients with brain injury had an average of 3.5 hours of therapy a day while taking part in inpatient rehabilitation. This includes physical, occupational, and speech therapy, as well as recreation therapy, vocational rehabilitation, and rehabilitation psychology. Patients here also have an assigned physician, respiratory therapy and dietitian if needed, and access to a chaplain.

St. Luke’s understands TBI and what the patient is working through, and gives them respect and care that we were so thankful for.
